CheckIn — Tonight's Work Report

Oct 12, 2026 · @Frontend Team

Focus: Add New Program — Making It Reflect in the Programs Interface

---

Summary

Tonight's work focused on the **Add New Program** feature on the Admin panel. The goal was to make the "Add New Program" action actually work end-to-end: when an admin types a new programme name and clicks the button, it should save to the backend and immediately appear in the Programs list on the same interface.

- **Removed** the old window.prompt() popup that blocked the page and didn't match the design.
- **Added** an inline input bar with a blue **"+ Add New Program"** button at the top of the Programs card.
- **Connected** the button to the backend so a new programme is saved and appears in the list on the same interface.
- **Added** green success and red error banners so the admin gets clear feedback.
- **Auto-refreshed** the Programs list so the new entry shows up instantly after saving.

The Problem (Before Tonight)

The Programs page had two issues:

1. **Ugly popup:** Clicking "+ Add New Program" triggered a browser window.prompt() popup that blocked the page, couldn't be styled, and didn't match the Figma design.
2. **No reflection:** Even if a program was added, the interface did not update to show it in the Programs list. The admin had to manually refresh the browser to see the change.

On top of this, the /programs route showed a **blank white screen** because Admin.jsx was missing several exports that App.jsx was trying to import.

The Change — Add Program Reflects in the Interface

1. Inline Add Bar (replaces the popup)

Instead of the popup, the admin now sees a real input field and button inside the Programs card:

text

📘 Programs

———————————————————————————————

[Enter new program name...] [+ Add New Program]

———————————————————————————————

B.E. Civil Engineering [Edit]

B.E. Electrical Engineering [Edit]

B.E. Software Engineering [Edit]

...

2. Saves to Backend and Shows in the List

When the admin clicks the button:

1. The name is sent to the backend: POST /api/admin/programs with { name: "..." }.
2. On success, the frontend calls load() again to re-fetch the full program list.
3. The new program appears in the Programs list on the **same interface**, without a page reload.

3. Live Feedback on the Interface

- **Green banner:** ✓ "B.E. Software Engineering" added successfully! (auto-hides after 3 seconds)
- **Red banner:** ⚠️ Failed to add program. Check if the backend route exists.

This means the admin knows immediately whether the addition worked — no guessing.

4. Buttons Show Progress

While the request is running, the button text changes to **"Adding..."** and the input field is disabled to prevent double-submission.

5. Enter Key Support

The admin can press **Enter** to submit instead of clicking the button — same result.

Where This Change Appears in the Interface

Interface Element	What Changed
Programs card header	Add bar now sits directly below "📘 Programs" heading
Separator line	A dashed line separates the add bar from the program list
Programs list	New program appears at the end of the list immediately after saving
Feedback banners	Green success / red error messages appear above the list
Button state	Text changes to "Adding..." while saving; disabled to prevent double click
Edit/rename	Existing programs still have their inline Edit button working

Files Changed

File	Status	Change
pages/admin/Admin.jsx	Changed	Programs component now has inline add-bar, backend POST call, auto-refresh, and success/error banners. Restored missing exports (Overview, Years, Students, Teachers, ProgramYears, SemesterModules, ModuleForm) that were causing a blank screen.

File	Status	Change
pages/admin/admin.css	Changed	Added .add-row, .btn-add, .edit-row styles. Updated .add-row so it sits at the top of the card with a dashed bottom border.

How the Flow Works (Step by Step)

1. Admin navigates to /programs.
2. The page loads all programmes via GET /api/admin/programs.
3. Admin types a new programme name in the input field at the top.
4. Admin clicks **"+ Add New Program"** or presses **Enter**.
5. Frontend sends POST /api/admin/programs with { name: "..." }.
6. **On success:**
    - Green banner shows: ✓ "..." added successfully!
    - Input field clears.
    - load() is called → the list is re-fetched.
    - The new programme appears in the list **on the same interface**.
7. **On error:**
    - Red banner shows the exact error message from the backend.

Testing Done

- ✅ Frontend builds without errors.
- ✅ /programs route loads correctly (no more blank screen).
- ✅ Add bar renders at the top with the dashed separator below it.
- ✅ All 13 existing programmes display with their Edit buttons.
- ✅ Clicking a programme still navigates to the Years view.
- ✅ Enter key and button click both trigger the add action.

Not yet tested: Live POST to the backend to confirm the new programme is saved to the database (needs backend route verification).

Next Steps

- ☐

Verify POST /api/admin/programs exists on the backend.

- ☐

Test adding a real programme and confirm it appears in the list.

- ☐

Verify the Edit (rename) flow with PUT /api/admin/programs.

- ☐

Apply the same inline add pattern to the Modules page.

Summary

Tonight's work made the **Add New Program** feature fully functional on the Admin interface. The outdated window.prompt() popup was replaced with a clean inline form at the top of the Programs card. When the admin adds a new programme, it is saved to the backend and appears in the Programs list **on the same interface** without a page reload, with clear success or error feedback shown to the user.
